Early Tenure, Overtime, and Compensation Drive Workforce Attrition

Key Insights

- 0-1 year employees show highest attrition at ~34%
- Overtime increases early tenure attrition to ~55%
- Lower income bands ($0-3k) show ~26% attrition
- Very low job satisfaction nearly doubles attrition vs very high

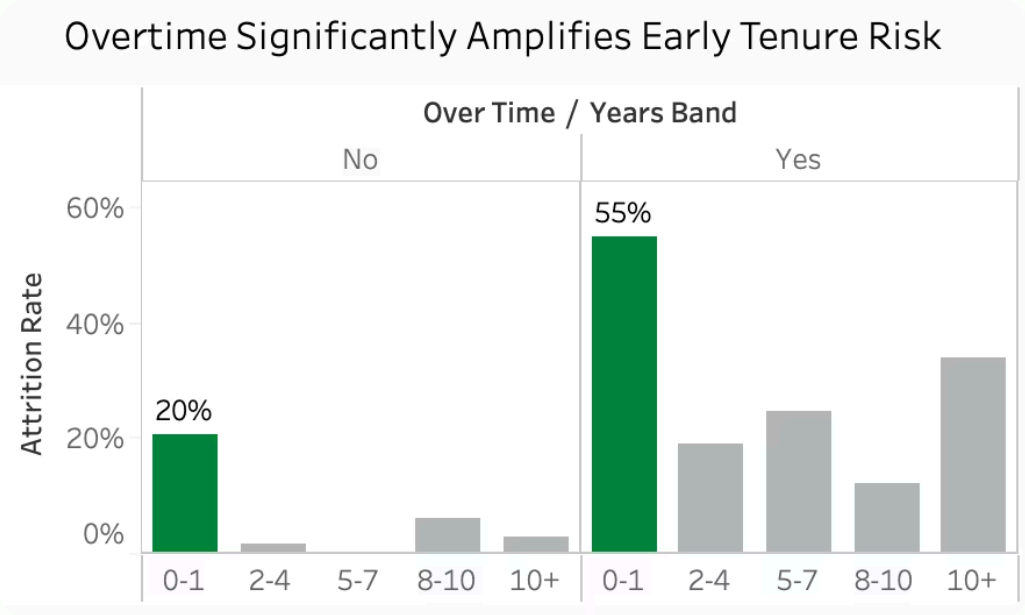
Overtime Nearly Triples Attrition Among First-Year Employees

Visual Analysis



Key Findings

0-1 years without overtime: ~20%

0-1 years with overtime: ~55%

Multiplier effect demonstrates overtime's compounding impact on early-tenure workforce stability.

Targeted Interventions Should Focus on High-Risk Segments

Limit Overtime for First-Year Employees

Early tenure employees experience ~55% attrition with overtime vs ~20% without. Reducing mandatory overtime for 0-1 year employees directly addresses the highest-risk segment.

Implement Cardiology-Specific Retention Programs

Cardiology shows ~14% overall attrition with ~34% in first year and ~19% even in 10+ year band. Department-specific interventions required to address structural risk.

Review Compensation Bands and Satisfaction Drivers

$0-3k band shows ~26% attrition. Job satisfaction differential shows ~16% attrition at Very Low vs ~8% at Very High. Compensation and satisfaction analysis needed.

Focused Retention Strategy Could Significantly Reduce Workforce Risk

Impact Outlook

- 199 employee exits currently reflect meaningful workforce instability and replacement cost exposure
- Reducing attrition by even 3-5 percentage points would retain approximately 50-80 additional employees annually
- Targeting early-tenure overtime exposure and compensation alignment could significantly reduce first-year churn
- Department-focused intervention in Cardiology could normalize attrition closer to the organizational average

Focused retention efforts would strengthen staffing stability, reduce replacement burden, and improve long-term workforce continuity.
